1 Automate Choisi

Nous avons choisi un automate pour reconnaitre tout les nombres dans \mathbb{R}

1, 2.0, -4.5, 10, +10, 0.45, -0.78, 85, 10.55...

2 Descripton de l'Automate Choisi

2.1 Definition

$$A = (\Sigma, E, e_0, F, \Delta)$$

Alphabet: $\Sigma = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ., -, +\}$

Etats: $E = \{e_0, e_1, e_2, e_3, e_4, e_5\}$

Etats Finaux: $F = \{e_2, e_3, e_5\}$

Etat Initial: $e_0 = e_0$

Transitions:

- $\delta(e_0, +) = e_1$
- $\delta(e_0, -) = e_1$
- $\delta(e_0, 0) = e_2$
- $\delta(e_0, 1) = e_3$
- $\delta(e_0, 2) = e_3$
- ...

4 Structures de Données

Pour stocker les noms des etats et les identifier nous avons utilisé des entiers au lieu de chaines de caracteres pour un soucis de simplicité

```
1 {
2     int nbSymboles;
3     int nbEtats;
4     int nbEtatsFinaux;
5     char *alphabet;
6     // TODO: change to string ?
7     int etatInitial;
8     Etat **etats;
9 };
```

Listing 1: Structure Automate

1 struct Etat
2 {
3     // TODO: change to string
4     int numero;
5     bool estFinal;
6     List *transitions;
7 };
```

3     char symbole;
4     // TODO: change to string
5     int source;
6     // TODO: change to string
7     int destination;
8 };
